

## Data Sheet

# OneClickEdit – One Click for All CMS Functions

Do you want to edit your website quickly and easily with one click?

Not a problem with OneClickEdit by imperia.

### Easy operation is a priority

An increasing number of corporate employees from different fields and in different roles are benefitting from Internet and intranet use. They use these media as everyday tools, draw information from them and enter new content: press releases from the PR manager, key figures for management from the controller, the menu from the canteen operator, etc. A content management system must be just as easy to operate to keep training costs down and to avoid operating errors.

### Easily edit content with one click

OneClickEdit is a true innovation in the content management market: all the desired content management functions are made directly available on the live site in the browser. The user can edit the content directly via the browser toolbar, which is similar to the familiar Google toolbar. With just one click of the mouse, the entire document is opened in WYSIWYG editing mode.

Additional user-defined content management functions can also be made available via OneClickEdit: deleting or duplicating a document, uploading an office document, retrieving the document history, tracking changes and much more. The imperia Workflow Engine is always running in the background to ensure workflow and rights compliance.

### Performance features

- Browser add-on for direct access to content management functions.
- A freely configurable toolbar can be displayed or hidden.
- The integration of user-defined CMS functions – imperia OneClickEdit is not limited to a few typical editing functions.

#### Examples of available functions:

- **Login** – jumps to the login screen
- **Duplicate** – generates a largely identical copy of an imperia document
- **Delete** – completely deletes the imperia document from all systems
- **Edit** – opens the entire document for editing
- **Reparse** – reparses the document so that changes to the template are adopted into the document
- **Links** – checks all of the internal and external links of a document
- **Info** – shows a list of administrative information about the document
- **Word upload** – for uploading office documents quickly
- **Validate** – checks the HTML code of the document for things such as accessibility using a service provided by the W3C Consortium
- **Change tracking:** with just one click, you can determine what changes your colleagues have made to your document. This allows changes to any pages to be viewed clearly at any time.

- Adding user-defined functions is easy: functions that are not available in the imperia system, such as a translation service or a search engine, can also be integrated.
- If the OneClickEdit toolbar is installed and the user visits a site, the user rights and document information are automatically retrieved and the rights to the functions of the toolbar are automatically activated accordingly.
- It can be used with Internet Explorer from Version 5.5 (Version 6 recommended), Mozilla from Version 1.3, Netscape from Version 7 and Firefox. Use of other browsers available on request.

**Simplicity pays off**

As part of the company-wide implementation of a content management system, an increasing number of employees will make use of the system in their daily work. It is essential that those who routinely work with the system should be able to use the software easily and that it should simplify their work. With OneClickEdit, you are just one mouse click away.

Conclusion: the shorter the editing times and the simpler the necessary processing steps, the lower the process costs will be.

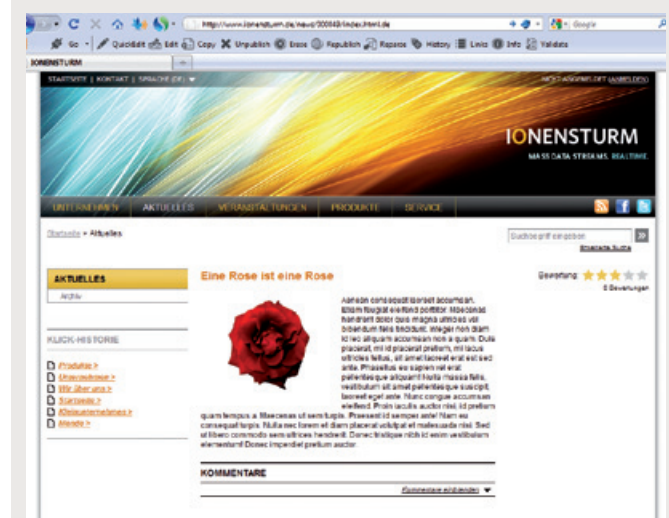

**Application example**  
**Calling a translation service**

OneClickEdit also simplifies the management of multilingual sites by providing you with the option of calling an external translation service. Once the first-language version of a document has been created, call a translation program for the present text using the corresponding OneClickEdit button and the desired translation will be returned to you. It will be automatically entered into a template and placed on the virtual imperia desktop to be checked by the appropriate colleague.

**OneClickEdit in use at AEG Haustechnik**

“With the help of imperia, we can now manage all of our content in-house. Our employees are thrilled by how imperia features such as OneClickEdit make their work much easier.”

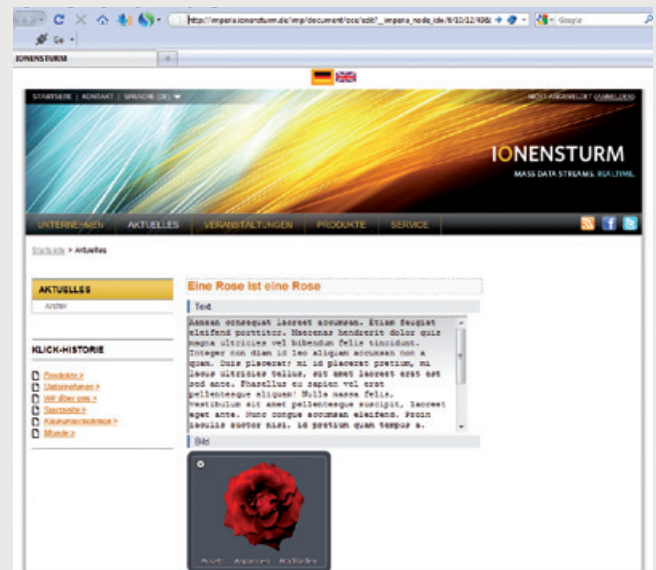

*Thomas Hödel, Head of Marketing at AEG Haustechnik*

Surf the live site of your Internet or intranet presence, ...

...select a function from the OneClickEdit toolbar such as “Edit”, for example, ...

...to obtain direct access to the template in WYSIWYG editing mode.
